

T Series of Digital Adjustor Instruction Manual

Warning

⚠ Caution

★ Applications

that make it is very precise, stable, strong anti-interference and simple operation. The instrument is widely applied to automation systems of mechanism, chemical industrial, chinaware, light industrial, metallurgy and petroleum chemical industrial. It is also applied to the production line of foodware, packing, printing, dry machine, metal heat process equipment to control the temperature.

■ Panel Illustration

- Ordering Code

Part-Number													Specifications	
TH													TH series	
Size	4												48H×48W mm	
	6												96H×48W mm	
	7												72H×72W mm	
	8												48H×96W mm	
	9												96H×96W mm	
	10												80H×160W mm	
Power	11												160H×80W mm	
		default											90-260V AC	
Control		E											24V±10% DC	
			default										Normal PID	
			V										Proportion control	
			F										3 phase shift control	
			R										Remote setting control	
			P										Programmable curve control	
Main output (Heating)													3 phase logic control	
													Simple phase shift control	
				R									Relay control output	
				S									SSR/Logic control output	
				T									SOR control output	
AL2 (Cooling)														
				I									4-20mA or 0-10mA	
				G									Pulse output	
				E									Others	
AL1													No OUT2/AL2	
				N									Relay control output	
													SSR/Logic control output	
				S									SOR control output	
				T									4-20mA or 0-10mA	
OUT2/AL2													Pulse output	
													Others	
													No AL1	
				R									Relay control output	
Communication													SSR/Logic control output	
				S									SOR control output	
				T										
Auxiliary Power													Non	
													Relay control output	
													SSR/Logic control output	
													SOR control output	
Input Signals 1														
Input Signals 2														

★ Thermocouple or RTD input selection

Input Type	Measured Range	Input Impedance	Factory Setting
TC	K: 0~1200℃	> 100K	Yes
	J: 0~1000℃		
	E: 0~1000℃		
	T: 0~400℃		
	B: 600~1700℃		
	R: 500~1600℃		
	S: 0~1700℃		
Pt	-200~600℃	≤0. 2mA	Special order
Cu50 Cu100	-50~150℃		

■ Specifications

Power supply	AC 90~260V
Consumption	≤6VA
Display range	-1999℃~9999℃
Accuracy	±0.3%FS±2digit
Sampling cycle	≤300MS
Function selection	programmable curve control, pulse width control, proportion control, phase shift control, normal PID, fuzz PID and autotuning PID control
OUT1 (PID1)	RELAY: Normal closed/ normal open AC 250V/3A DC 30V/3A COSφ=1 SSR/LOGIC: DC 24V±1V/20mA TRIGIC (SCR) : External connect with SCR I: 4~20mA、0~10mA、0~20mA
OUT2/AL2 (PID2)	RELAY: Normal closed/ normal open AC 250V/3A DC 30V/3A COSφ=1 SSR/LOGIC: DC 24V±1V/20mA TRIGIC (SCR) : External connect with SCR I: 4~20mA、0~10mA、0~20mA
AL1、AL2 AL3 11 types of alarm modes	RELAY: Normal closed/ normal open AC 250V/3A DC 30V/3A COSφ=1 SSR/LOGIC: DC 24V±1V/20mA TRIGIC (SCR) : External connect with SCR
Withstand voltage strength	1500V Rms (Between power terminal and the housing)
Insulation resistance	Min 50MΩ (500V DC) (Between power terminal and the housing)
Environment temperature	0~50℃
Save temperature	-10℃~60℃
Environment humidity	35~85%RH
Weight	TH4≤250g TH6/TH7/TH9: ≤300g

Mounting and Sizes

Sizes Model	A	B	C	D	E	F	G	H
TH4	44.5±0.5	45±0.5	65	65	48	48	8	80
TH6	43.5±0.5	91±0.5	65	115	48	96	12	80
TH7	67.5±0.5	67.5±0.5	95	95	72	72	12	80
TH8	91±0.5	44.5±0.5	115	65	96	48	12	80
TH9	91±0.5	91±0.5	115	115	96	96	12	100
TH10	152±0.5	76±0.5	180	100	160	80	12	80
TH11	76±0.5	152±0.5	100	180	80	160	12	80

Operation instructions

1. Mode convert

The instrument will return to the displaying estate main setting mode without key operation for 25 seconds in any case.

2. Key operation

A: Press SET key to select the parameter you want to modify
B: Press <</>M key to shift the digit you want to modify
C: Press ▲/▼ key to modify the value of the parameter
D: Press SET key to confirm

3. Basic function convert

A: SV displaying convert: Press SET key, P/MV lamp on, displaying MV value. P/MV lamp off, displaying SV value, P/MV lamp flashes, displaying PV2 value.

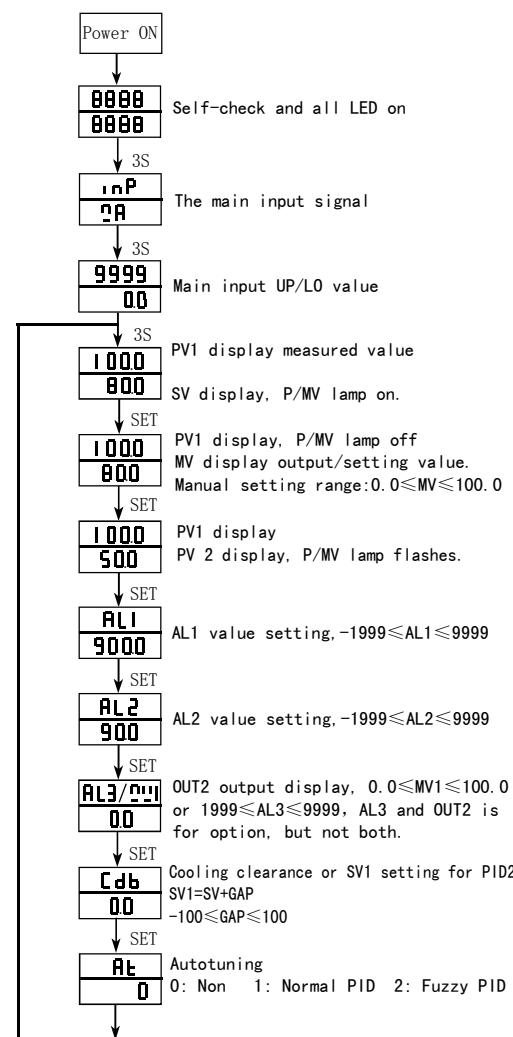

B: SV setting operation: The value can be modified when P/MV lamp off. Press key to shift the digit, and press ▲/▼ key to modify, and then press SET key to confirm.

C: MV setting operation: When P/MV lamp on, it is for manual operation, please modify the value as B.

D: Manual/Autotuning convert: Press <</>M key for more than 2 seconds, when AT/M lamp on it means manual, when the lamp off, it means autotuning.

E: Autotuning operation: When the system is running correctly, please let the instrument enter autotuning. Please don't set parameter AT=0, the AT/M lamp flashes, it means the instrument are in autotuning estate. When the AT/M lamp off, it means autotuning finished. The data will be record in memory. If the the system not changed too much, no need autotuning next time.

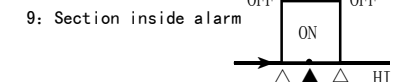

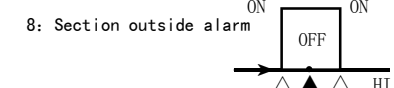

Operation process

ON/OFF control: ▲Setting value

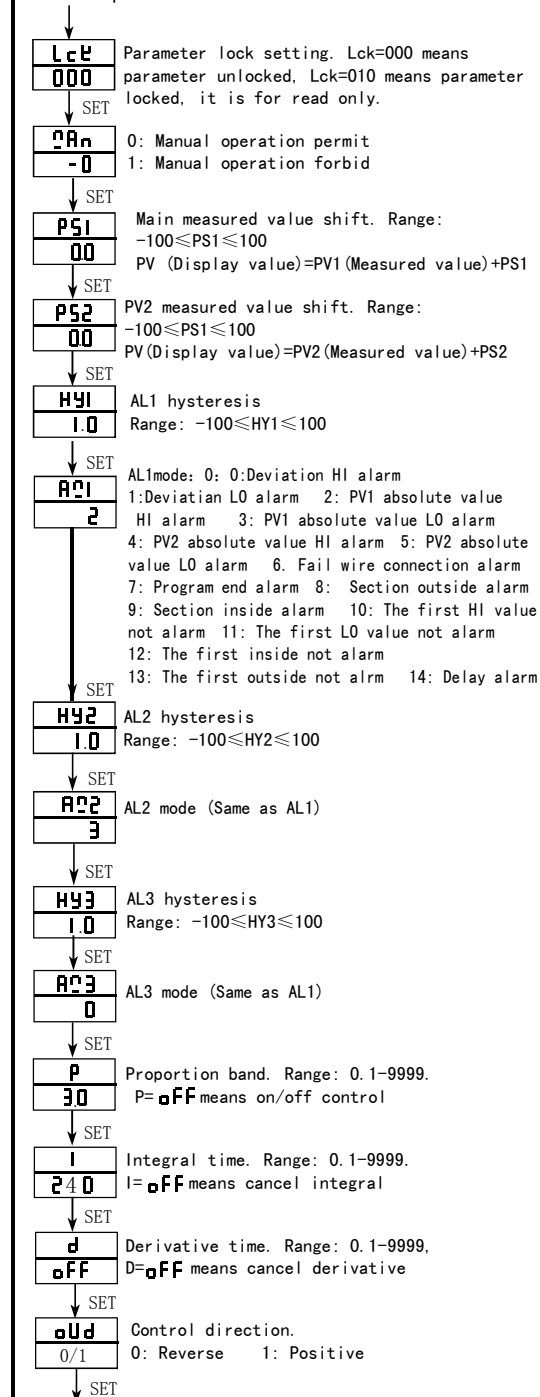

Alarm mode: ▲Set value △Alarm value

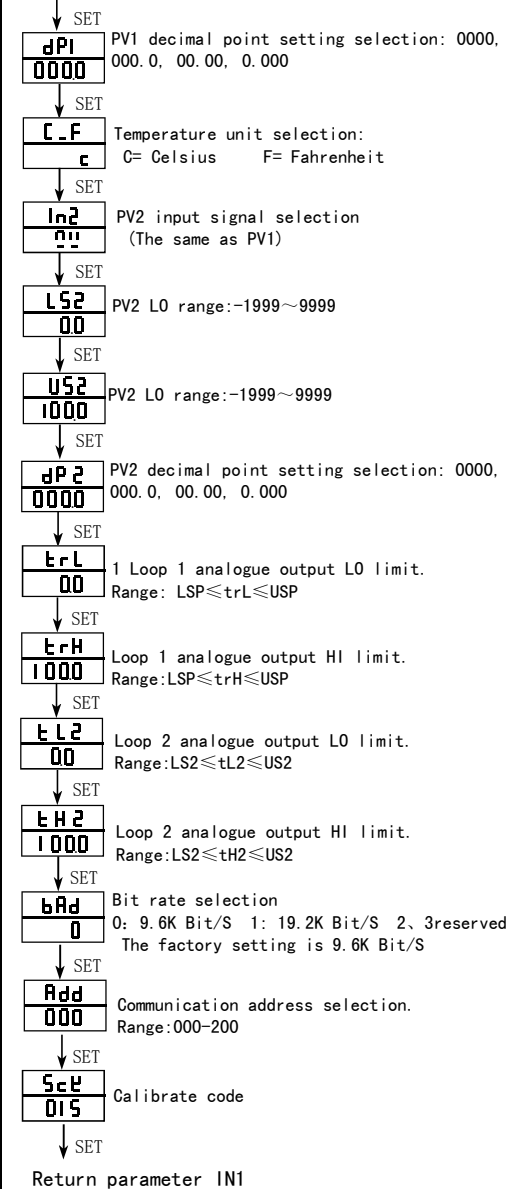

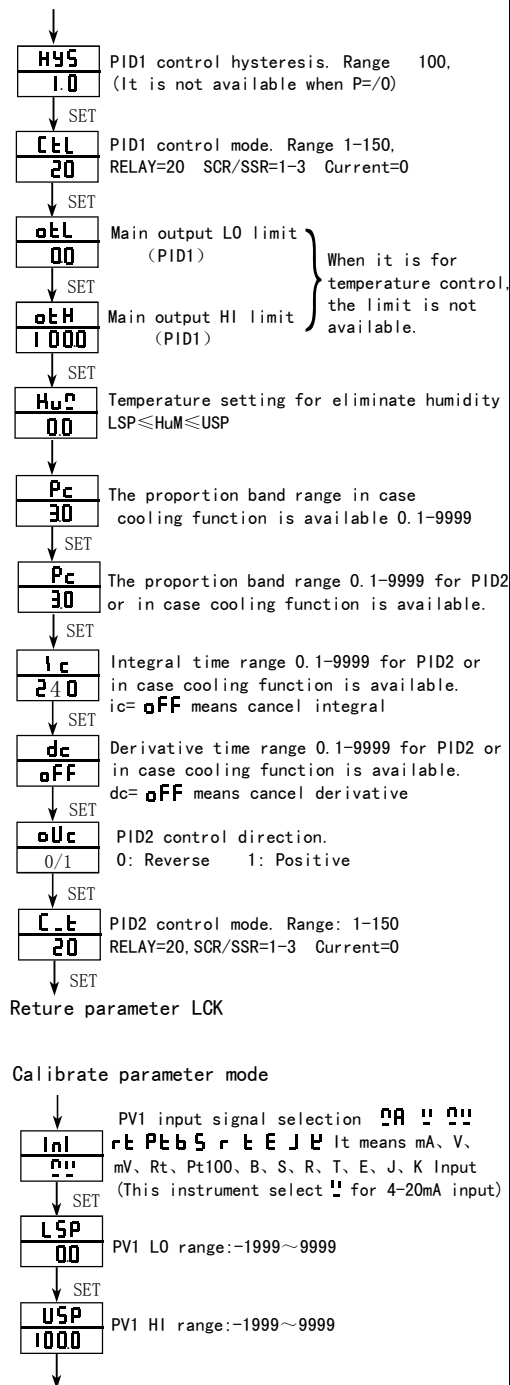

☆All the factory setting value of deviation alarm is 1.0. If the user want to change, please contact us or our distributors.

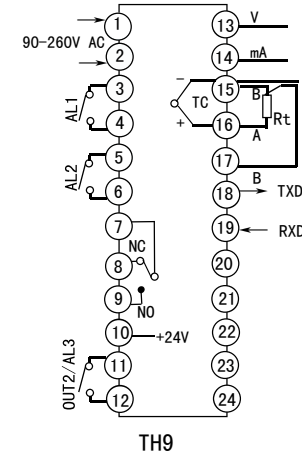

Alarm mode 6 and 7 is reserved for use.

Control parameter mode

Terminal connections

(If any changed, please refer to the product showing)

Application examples

1、Relay output control (for TH9)

Note:AL1 is LOW limit alarm used for over-heated control.

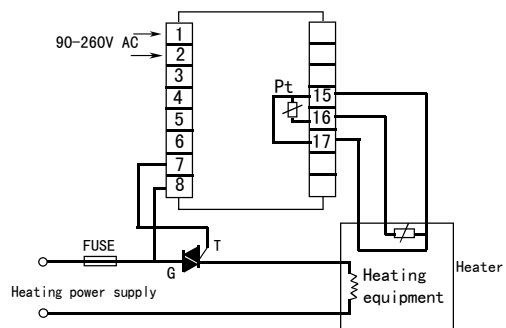

2. Heating control

3. SSR reverse and positive connection

4. SSR both directions connection

5. Two input connection

Malfunction estimate

1. No displaying

Check all the connection and wiring if it is correct. Specially pay attention to the power supply terminals and signal input terminals, please do not wrong connect. As well pay attention to do not short the output terminals by strong current.

2. Incorrect displaying

Check if the input signal is conformity with the selected symbol. For TC input, please use the relative compensation cable. For RTD input, please use low impedance cable. The 3 wires should at the same length. If the user doubts the accuracy of the sensor or the instrument, please put the sensor into the boiling water to check if the instrument indicates 100 C degrees. And put the sensor into the ice-water admixture to check if the instrument indicates 0 C degrees.

3. Wrong control

If the temperature becomes higher and higher, but the numerals showing lower and lower, the TC input connection must be contrary. If the instrument has been used for a long time, the user find that the displaying float or the temperature is hard to rise up to the set value, meanwhile the outside system running well, there must be something wrong with the parameters of the instrument.

The user need to re-autotuning the instrument. If the instrument lost control, please check if the connection of the control is correct. If external load is shorted, broken, wrong connection or components is damaged, it will cause lost control as well. When it is necessary, please push out the PCB to check the if the output terminals is damaged and not available.

4. Display UUUU or LLLL

When the instrument displays UUUU, it means the input signal exceed the measured HI range. When the instrument displays LLLL, it means the input signal exceed the measured LO range, or input signal terminal connection is contrary.
